Figure S2  Linkage disequilibrium patterns of the genomic region surrounding evQTL at ALG11. The entire region of the analysis included 38 SNPs over a ~400 kb span. The cis-evSNPs are indicated with red boxes. The haplotypes in the LD block accommodating evSNPs are displayed in insert, with corresponding haplotype frequencies. Of note, alleles of evSNPs resulting in larger variance of gene expression are allocated in one haplotype highlighted with blue box.
