Figure S13  Reduction of MAPK activity does not alter SEV levels. Adult fly retinae (A-B) or third instar eye discs stained using an anti-SEV antibody (C-D) are shown. Compared to WT (A-C), the homozygous rolled¹ (rl¹) mutation (B-D) causes eye roughness owing to the loss ommatidial cells, but does not modify SEV levels or expression pattern. Arrowheads mark the position of the morphogenetic furrow. Anterior is to the right.
