Figure S7  Daughter nuclei from pulse-induced cells carrying CENP-A^{nop1}–GFP show multiple CENP-A^{nop1}–GFP foci 18 hrs after addition of thiamine. In contrast, daughter nuclei from cells expressing endogenous-level CENP-A^{nop1}–GFP display single CENP-A^{nop1}–GFP focus (top panel). Note that daughter nuclei from a pulsed-induced cell (middle and bottom panels) show near identical distribution of ectopic CENP-A–GFP foci, suggesting inheritance of these sites from mother to daughter cells.
