

**Supplemental figure 3.** A) The number and haplotype blocks across CC cohorts. B) The length of haplotype blocks across CC cohorts. C) Heterozygosity per generation in CC extinct lines. The blue line represents predicted heterozygosity from a simulated model and the red line represents the observed fit line. Gray shading represents a 95% CI for the observed fit line. D) Genome wide distribution of heterozygosity of the CC extinct and CC sequenced populations. E) Pairwise founder contributions to heterozygosity across CC cohorts.
