**Figure S6.**—Medians of the likelihood ratio values for testing differential expression between human and chimpanzee. Black: genes not associated with duplications (---). Blue: genes associated with duplications that do not overlap CNVs in both species (HC). Red: genes associated with either human-specific (H-) or chimpanzee-specific (-C) duplications, which do not overlap CNVs in either species. The error bars are 95% confidence intervals calculated using bootstrapping (1000 repetitions).
