

FIGURE S2.—Quantification of the *fks1* mutants' cell morphology from fluorescence images. All strains were cultured at 25° until early log phase, and shifted to 35.5° for 4 hours. Cells were stained with FITC-Con A, rhodamine-phalloidin and DAPI for cell wall, actin and nucleus, respectively. The numbers of independent experiments were 5 for mutants and 20 for WT. Over 200 cells per experiment were captured.
