Figure S1.—Diagrams of chemotaxis assay plates. For procedures of chemotaxis assays, see MATERIALS AND METHODS.
FIGURE S2.—The *gcy-22* mutations isolated in the suppressor screening. The complete amino acid sequence of GCY-22, which was found to be identical to the current gene model T03D8.5. Bold and underlined characters indicate the amino acid residues that are affected by mutations obtained in the suppressor screening. For the mutations, also see FIGURE 1C and MATERIALS AND METHODS.
