Figure S2. We plot $F_{ST}$ for standard and inverted regions of each chromosome arm. Inverted regions are indicated by gray horizontal lines. Blue series indicate average $F_{ST}$ values over 25kb windows slid every 10kb; red lines show 200kb windows slid 50kb at a time. Overall $F_{ST}$ across each region (standard vs. inverted) is also indicated in each panel. Note that there is no inversion on the X chromosome.
