FIGURE S3.—Western blot analysis providing evidence for translation from the predicted ORFs at the new13 and tam2 loci. Three copies of the “Pk” (SV5 epitope) tag were inserted in frame before stop and termination sequences at the 3’ end of the new13 and tam2 predicted ORFs using standard PCR cassette mediated tagging [17] and extracts were prepared from the resultant strain and wild type cells for immuno-blotting using standard techniques. In each case a single band was detected in the tagged strain, but not the isogenic untagged wild type control.
