Figure S9  Transgene *hs-hid* also inhibits *EGFP* RNAi when it is located on chromosome 2. An increased level of green fluorescence was detected in mid-guts (left) and salivary glands (right) in the *hs-hid* animals. Midguts were collected from early third instar larvae. Salivary glands were collected from wandering third instar (late) larvae. The controls were located to the right of each image. The genotypes of the strains are labeled above.
