Figure S18  Summary of the folded site-frequency spectrum using Tajima’s D. Boxplots give the observed distributions across amplicons, while colored points denote outliers (red = lower tail, blue = upper tail) at the $P = 0.05$ level. Whiskers extend to the extremes of the observed data. (A) The standard neutral model (SNM). Counts are given above this panel. (B) The three-epoch model (TEM) from Ersöz et al. (2010). Counts are given above this panel.
