Figure S4. Interrupting mating after sperm and SFP transfer does not affect progression of the uterine conformational changes. Comparison of females mated to control males when mating was interrupted at 13min (Cont-int) vs. mating that was not interrupted (Cont). Uterine progression occurs normally once females have received SFPs during mating (N_{cont-int}=25, N_{cont}=25, Z=0.11, P=0.92).
