

Figure S2. Expression of *tsI* is not induced following bacterial infection.

tsI^{A/+} flies were infected with *S. aureus* or *E. coli* bacteria and sampled at 0 and 12 hours following infection, and expression levels of *tsI* were quantified relative to *Rp49*.

(A) The expression of *tsI* was not significantly induced following *S. aureus* infection (A; t-test, $p=0.093$) or *E. coli* infection (B; $p=0.052$). Data is presented as the mean \pm 1 standard error of four biological replicates.
