

Figure S2 Ubiquitin- and SUMO-dependent protein degradation pathways not required for rapamycin-induced Tec1 destruction. Yeast strains of the indicated genotype (listed in Table 1) were grown in the presence of rapamycin (+) or drug vehicle (-) and analyzed for Tec1 protein levels as described in Fig. 1. Known functions of the proteins missing in the different mutant strains are indicated (for further references see SGD project; <http://www.yeastgenome.org/>).
